Chapter 3

Class Documentation

3.1 BTNode Class Reference

Collaboration diagram for BTNode:

Public Member Functions

- [BTNode](#) ([Products](#) dataVal)
- char [nodeName](#) ()
- [Products](#) [nodeData](#) ()
- int [nodeRatio](#) ()

Public Attributes

- [BTNode](#) * [left](#)
- [BTNode](#) * [right](#)
- [BTNode](#) * [parent](#)

3.1.1 Detailed Description

Definition at line 48 of file main.cpp.

3.1.2 Constructor & Destructor Documentation

3.1.2.1 BTNode()

```
BTNode::BTNode (
    Products dataVal ) [inline]
```

BTNode constructor

Parameters

<i>dataVal</i>	This is the product that is put into the binary tree.
----------------	---

Definition at line 59 of file main.cpp.

```
59      {
60          //cout << "name = " << name << endl;
61          left = NULL;
62          right = NULL;
63          parent = NULL;
64          objName = name++;
65          data = dataVal;
66      }
```

3.1.3 Member Function Documentation

3.1.3.1 nodeData()

```
Products BTNode::nodeData ( ) [inline]
```

This reports the node's data

Definition at line 78 of file main.cpp.

```
78      {
79          return (data);
80      }
```

3.1.3.2 nodeName()

```
char BTNode::nodeName ( ) [inline]
```

This reports the node's name

Definition at line 71 of file main.cpp.

```
71      {
72          return (objName);
73      }
```

3.1.3.3 nodeRatio()

```
int BTreeNode::nodeRatio ( ) [inline]
```

This reports the node's ratio, currently breaks something by converting it to an int, don't use for comparisons.

Definition at line 85 of file main.cpp.

```
85     {  
86         return(data.ratio);  
87     }
```

3.1.4 Member Data Documentation

3.1.4.1 left

```
BTreeNode* BTreeNode::left
```

Definition at line 50 of file main.cpp.

3.1.4.2 parent

```
BTreeNode* BTreeNode::parent
```

Definition at line 52 of file main.cpp.

3.1.4.3 right

```
BTreeNode* BTreeNode::right
```

Definition at line 51 of file main.cpp.

The documentation for this class was generated from the following file:

- /home/lee/Leecmake/CPTR227FinalProject/src/[main.cpp](#)

3.2 Products Class Reference

Public Member Functions

- [Products](#) ()
- [Products](#) (double p, double w)

Public Attributes

- double `price`
- double `weight`
- double `ratio`

3.2.1 Detailed Description

This is class has 2 different parameters used to make this object

Definition at line 22 of file main.cpp.

3.2.2 Constructor & Destructor Documentation

3.2.2.1 Products() [1/2]

```
Products::Products ( ) [inline]
```

Definition at line 31 of file main.cpp.

```
31     {  
32  
33     }
```

3.2.2.2 Products() [2/2]

```
Products::Products (  
    double p,  
    double w ) [inline]
```

This is the constructor for this class

Parameters

<i>p</i>	The price for the product.
<i>w</i>	The weight for the product.

Definition at line 41 of file main.cpp.

```
41     {  
42         price = p;  
43         weight = w;  
44         ratio = w/p;  
45     }
```

3.2.3 Member Data Documentation

3.2.3.1 price

```
double Products::price
```

Definition at line 27 of file main.cpp.

3.2.3.2 ratio

```
double Products::ratio
```

Definition at line 29 of file main.cpp.

3.2.3.3 weight

```
double Products::weight
```

Definition at line 28 of file main.cpp.

The documentation for this class was generated from the following file:

- /home/lee/Leecmake/CPTR227FinalProject/src/[main.cpp](#)

Chapter 4

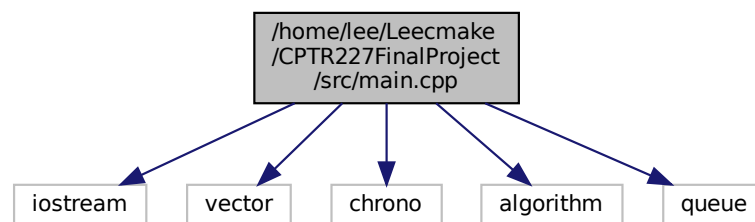

File Documentation

4.1 /home/lee/Leecmake/CPTR227FinalProject/src/main.cpp File Reference

This is the final project made with code from HW11.

```
#include <iostream>
#include <vector>
#include <chrono>
#include <algorithm>
#include <queue>
```

Include dependency graph for main.cpp:

Classes

- class [Products](#)
- class [BTNode](#)

Functions

- `BTNode * addNode (BTNode *rootNode, BTNode *n)`
- `BTNode * addNode (BTNode *rootNode, Products dataval)`
- `int randomGen (int min, int max)`
- `std::vector< Products > genProducts (int n)`
- `void printTree (BTNode *rootNode)`
- `void printBT (const string &prefix, BTNode *node, bool isLeft)`
- `void printBT (BTNode *node)`
- `void createTreeBruteForce (vector< Products > &tree, int index)`
- `void RandomTree (vector< Products > &tree, int index)`
- `void createTree (vector< Products > &tree, int index)`
- `bool comparator (const Products &a, const Products &b)`
- `int main (int, char **)`

4.1.1 Detailed Description

This is the final project made with code from HW11.

This program is based on the knapsack problem and uses a binary tree to store the data.

Author

Daniel Pervis and Lee Beckermeyer

Date

4/21/2021

4.1.2 Function Documentation

4.1.2.1 addNode() [1/2]

```
BTNode* addNode (
    BTNode * rootNode,
    BTNode * n )
```

This function adds a node to a binary search tree.

Parameters

<i>rootNode</i>	is the pointer to the tree's root node
<i>n</i>	is the node to add

Returns

pointer to rootNode if successful, NULL otherwise

Definition at line 105 of file main.cpp.

```

105                                     {
106     BTreeNode* prev = NULL;
107     BTreeNode* w = rootNode;
108     if(rootNode == NULL) { // starting an empty tree
109         rootNode = n;
110     } else {
111         // Find the node n belongs under, prev, n's new parent
112         while(w != NULL) {
113             prev = w;
114             if(n->nodeData().ratio < w->nodeData().ratio) {
115                 //cout << w->nodeData().ratio << " added" << endl;
116                 w = w->left;
117             } else if(n->nodeData().ratio > w->nodeData().ratio) {
118                 //cout << w->nodeData().ratio << " added" << endl;
119                 w = w->right;
120             } else { // data already in the tree
121                 return(NULL);
122             }
123         }
124         // now prev should contain the node that should be n's parent
125         // Add n to prev
126         if(n->nodeData().ratio < prev->nodeData().ratio) {
127             prev->left = n;
128         } else {
129             prev->right = n;
130         }
131     }
132     return(rootNode);
133 }

```

4.1.2.2 addNode() [2/2]

```

BTreeNode* addNode (
    BTreeNode * rootNode,
    Products dataval )

```

Adds a new node with the passed data value

Parameters

<i>rootNode</i>	pointer to root node
<i>dataval</i>	an integer for the new node's data

Returns

pointer to root node or NULL if not successful

Definition at line 142 of file main.cpp.

```

142                                     {
143     BTreeNode* newNode = new BTreeNode(dataval);
144     if(addNode(rootNode, newNode) == NULL) {
145         //cout << dataval.ratio << " already in tree" << endl;
146     } else {
147         //cout << dataval.ratio << " succesfully added" << endl;
148     }
149     return(rootNode);
150 }

```

4.1.2.3 comparator()

```
bool comparator (
    const Products & a,
    const Products & b )
```

compares 2 products

Parameters

<i>a</i>	product a
<i>b</i>	product b

Definition at line 338 of file main.cpp.

```
338                                     {
339     return a.ratio > b.ratio;
340 }
```

4.1.2.4 createTree()

```
void createTree (
    vector< Products > & tree,
    int index )
```

creates a binary tree

Parameters

<i>tree</i>	a vector of products you want to turn into a tree.
<i>index</i>	the size of the vector, needed with the current implementation.

Definition at line 324 of file main.cpp.

```
324                                     {
325     BTreeNode* root = new BTreeNode(tree[index]);
326     for (Products x : tree){
327         addNode(root, x);
328     }
329     printBT(root);
330 }
```

4.1.2.5 createTreeBruteForce()

```
void createTreeBruteForce (
    vector< Products > & tree,
    int index )
```

creates a binary tree, also checks if the knapsack is full, if the knapsack isn't full it continues until the end of the vector.

Parameters

<i>tree</i>	a vector of products you want to turn into a tree.
<i>index</i>	the size of the vector, needed with the current implementation.

Definition at line 256 of file main.cpp.

```

256                                     {
257     BTreeNode* root = new BTreeNode(tree[index]);
258     int weight = 0;
259     int price = 0;
260     for (Products x : tree){
261         int newweight = x.weight + weight;
262         int newprice = x.price + price;
263         if(newweight>=500){
264             continue;
265         }
266         else{
267             weight = newweight;
268             price = newprice;
269             addNode(root, x);
270             x.weight + weight;
271             x.price + price;
272         }
273     }
274
275 };
276 cout << "Tree generated using a brute force algorithm after sorting the object's ratios" << endl;
277 cout << "Weight of the Knapsack: " << weight << " lbs" << endl;
278 cout << "Price of the Knapsack: " << price << "$" << endl;
279 cout << "Ratio of the Tree(weight/price): " << (double)500/price << endl;
280 printBT(root);
281 };

```

4.1.2.6 genProducts()

```

std::vector<Products> genProducts (
    int n )

```

generates the products.

Parameters

<i>n</i>	The amount of products you want generated.
----------	--

Definition at line 172 of file main.cpp.

```

172                                     {
173     vector<Products> output;
174     for (int i = 0; i < n; i++) {
175         output.push_back(Products(randomGen(1,1000), randomGen(5, 200)));
176     }
177     return output;
178 }

```

4.1.2.7 main()

```

int main (
    int ,
    char ** )

```

Definition at line 342 of file main.cpp.

```

342         {
343             srand(time(NULL));
344             vector<Products> products = genProducts(50);
345             auto max = std::max_element(products.begin(), products.end(), [](const Products& a, const Products&
b){
346                 return a.ratio < b.ratio;
347             });
348             int index = distance(products.begin(), max);
349             cout << max->ratio << endl;
350             cout << products[index].ratio << endl;
351             //sort(products.begin(), products.end(), &comparator); NO TOUCHY
352             for (int i = 0; i < products.size(); i++) {
353                 cout << i << " : " << products[i].ratio << endl;
354             }
355
356             //for (Products x : products){
357             //    cout << x.ratio << endl;
358             //}
359             RandomTree(products, index);
360             createTreeBruteForce(products, index);
361
362     }
```

4.1.2.8 printBT() [1/2]

```

void printBT (
    BTreeNode * node )
```

An overload to simplify calling printBT

Parameters

<i>node</i>	is the root node of the tree to be printed
-------------	--

Definition at line 245 of file main.cpp.

```

246 {
247     printBT("", node, false);
248 }
```

4.1.2.9 printBT() [2/2]

```

void printBT (
    const string & prefix,
    BTreeNode * node,
    bool isLeft )
```

Print a binary tree

This example is modified from: <https://stackoverflow.com/a/51730733>

Parameters

<i>prefix</i>	is a string of characters to start the line with
<i>node</i>	is the current node being printed
<i>isLeft</i>	bool true if the node is a left node

Definition at line 221 of file main.cpp.

```

222 {
223     if( node != NULL )
224     {
225         cout << prefix;
226
227         cout << (isLeft ? "L--" : "R--" );
228
229         // print the value of the node
230         //cout << node->nodeName() << ':' << node->nodeData() << std::endl;
231         cout << node->nodeData().ratio << std::endl;
232
233         // enter the next tree level - left and right branch
234         printBT( prefix + (isLeft ? "| " : " ") , node->left, true);
235         printBT( prefix + (isLeft ? "| " : " ") , node->right, false);
236     }
237 }
```

4.1.2.10 printTree()

```

void printTree (
    BTreeNode * rootNode )
```

prints a binary tree

Parameters

<i>rootNode</i>	The binary tree you want printed.
-----------------	-----------------------------------

Definition at line 185 of file main.cpp.

```

185 {
186     queue<BTreeNode*> todo; // the queue of nodes left to visit
187     BTreeNode* cur; // current node
188     BTreeNode* prev; // The previous node
189
190     todo.push(rootNode);
191
192     while(!todo.empty()) {
193         cur = todo.front();
194         // Print current node
195         cout << cur->nodeName() << ':' << cur->nodeData().ratio << '\t';
196         // add cur->left to queue
197         if(cur->left != NULL) {
198             todo.push(cur->left);
199         }
200         // add cur->right to queue
201         if(cur->right != NULL) {
202             todo.push(cur->right);
203         }
204         // remove cur from queue
205         todo.pop();
206     }
207     cout << endl;
208 }
```

4.1.2.11 randomGen()

```

int randomGen (
    int min,
    int max )
```

Randomly generates a "double"(float in C++) number

Parameters

<i>min</i>	The minimum number that can be generated.
<i>max</i>	The maximum number that can be generated.

Definition at line 159 of file main.cpp.

```

159         {
160
161     double random = rand() % max + min;
162     //int random = rand() % max + min;
163     //cout << rand() % max << endl;
164     return random;
165 }
```

4.1.2.12 RandomTree()

```

void RandomTree (
    vector< Products > & tree,
    int index )
```

creates a binary tree, also checks if the knapsack is full, if the knapsack isn't full it continues until the end of the vector.

Parameters

<i>tree</i>	a vector of products you want to turn into a tree.
<i>index</i>	the size of the vector, needed with the current implementation.

Definition at line 289 of file main.cpp.

```

289         {
290     BTreeNode* root = new BTreeNode(tree[index]);
291     cout << tree[index].ratio << endl;
292     int weight = 0;
293     int price = 0;
294     int n = 0;
295     while(n < 10){
296         n++;
297         Products x = tree[randomGen(0,index)];
298         int newweight = x.weight + weight;
299         int newprice = x.price + price;
300         if(newweight>=500){
301             continue;
302         }
303         else{
304             weight = newweight;
305             price = newprice;
306             addNode(root, x);
307             x.weight + weight;
308             x.price + price;
309         }
310     }
311     cout << "Tree generated using a random algorithm" << endl;
312     cout << "Weight of the Knapsack: " << weight << " lbs" << endl;
313     cout << "Price of the Knapsack: $" << price << endl;
314     cout << "Ratio of the Tree(weight/price): " << (double)500/price << endl;
315     printBT(root);
316 };
```
